Carbohydrates Metabolism

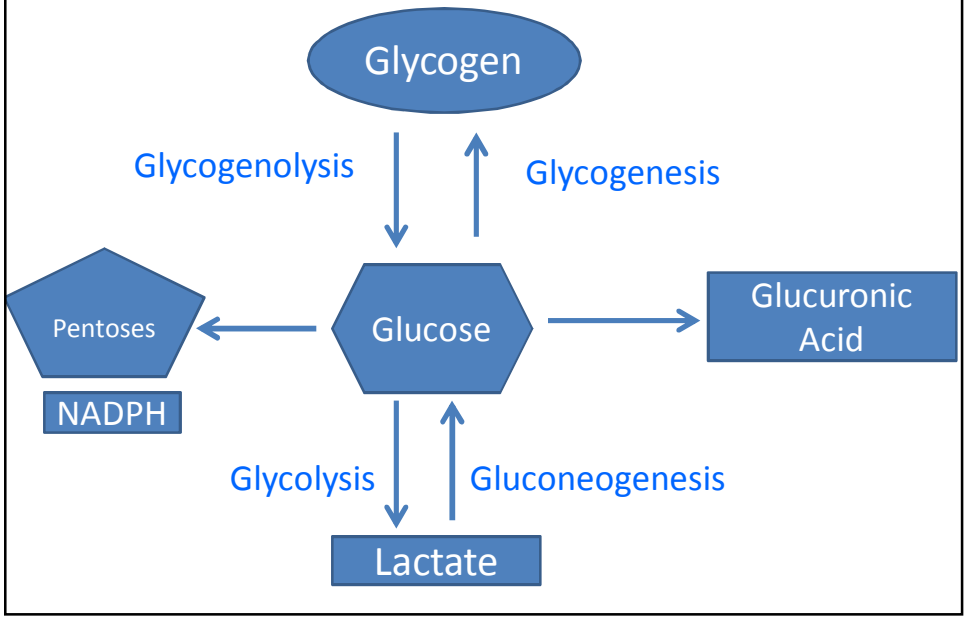
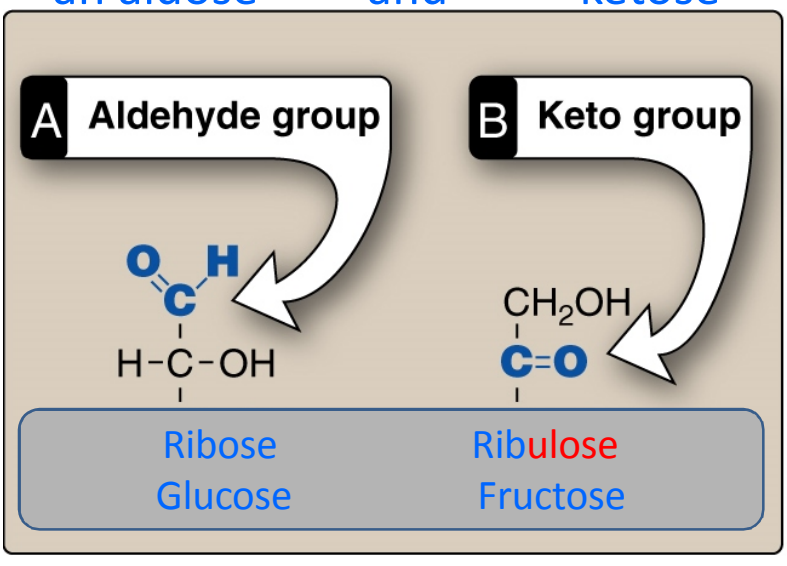
- Objectives
  - Utilization of Glucose → Energy
  - Non-Carbohydrates → Glucose
  - Storage of Glucose → Glycogen
  - Release of Glucose from Glycogen
  - Reducing Power NADPH >> GSH
  - Glucuronic acid >> Drug metabolism
  - Interconversion of sugars

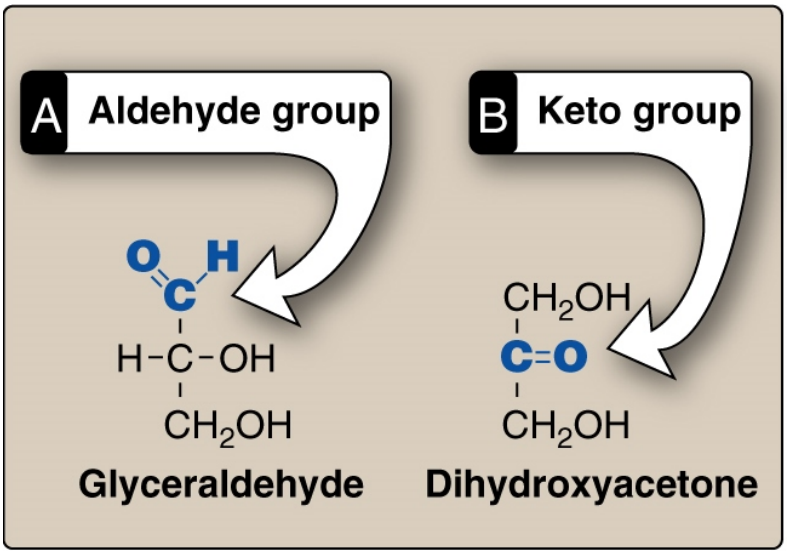
An Over-all Picture



Examples of an aldose and ketose

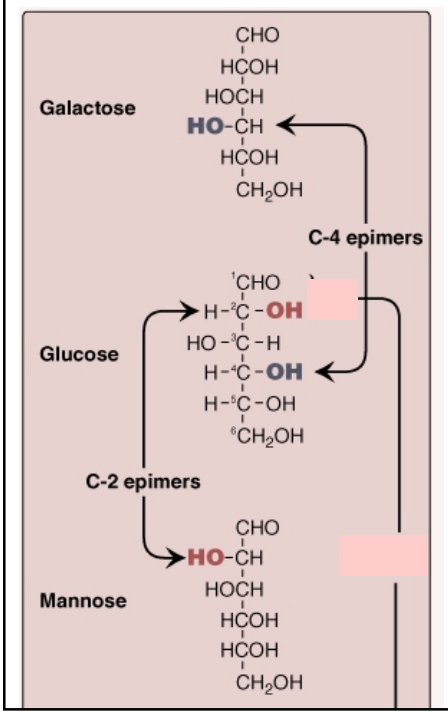


Examples of an aldose and ketose



Examples of monosaccharides found in human

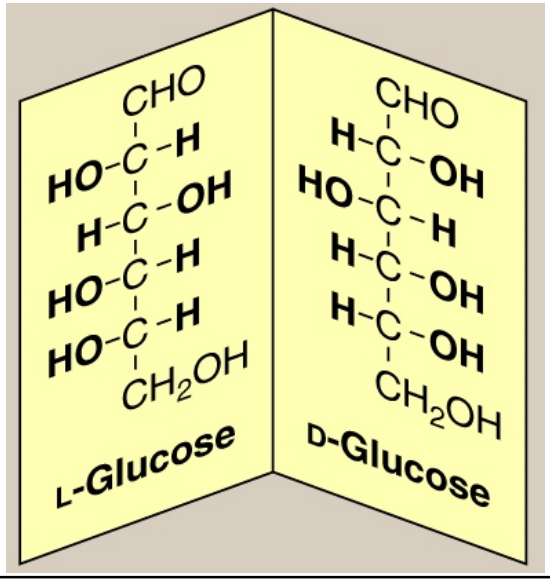
Generic names	Examples
3 carbons: trioses	Glyceraldehyde
4 carbons: tetroses	Erythrose
5 carbons: pentoses	Ribose
6 carbons: hexoses	Glucose
7 carbons: heptoses	Sedoheptulose
9 carbons: nonoses	Neuraminic acid

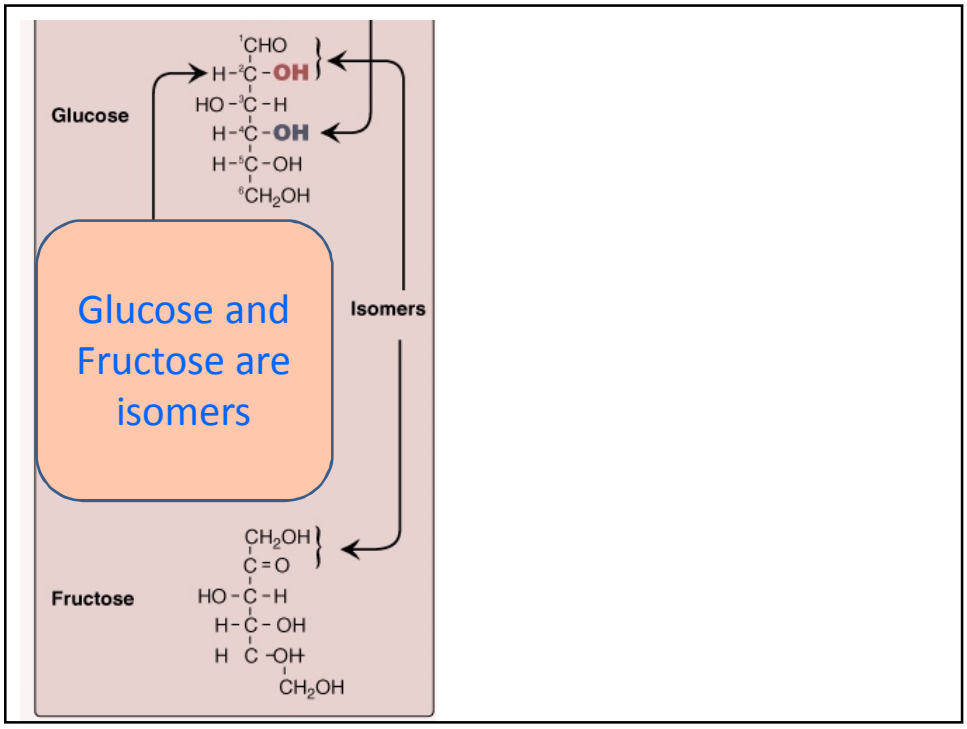


Isomers

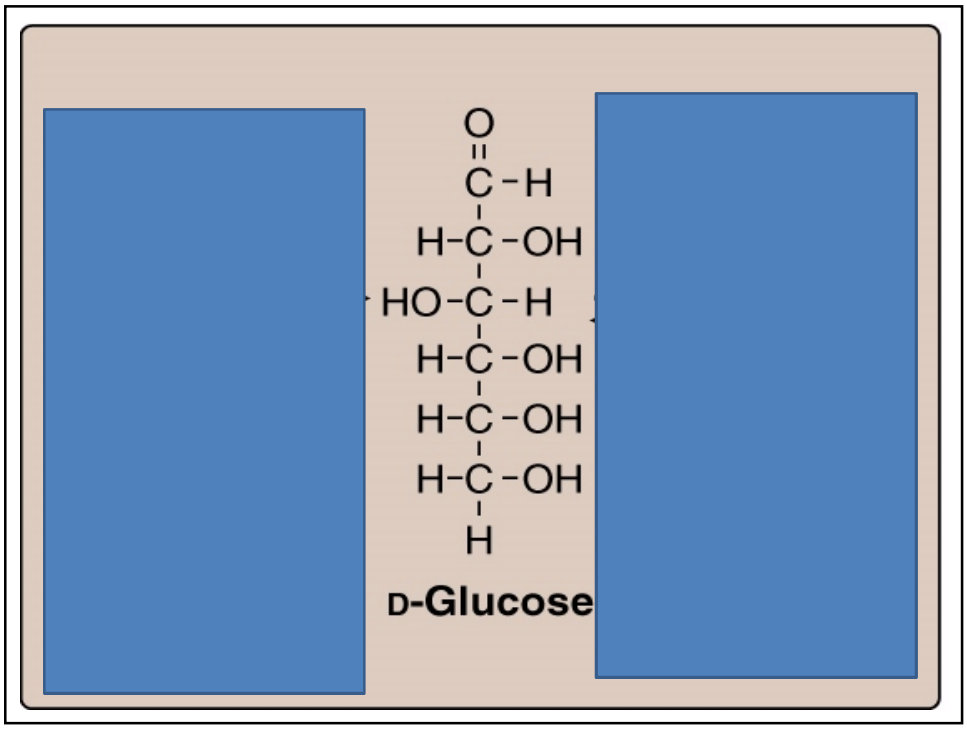
Epimers areisomers:

Changing the orientation of one hydroxyl group will produce different sugar

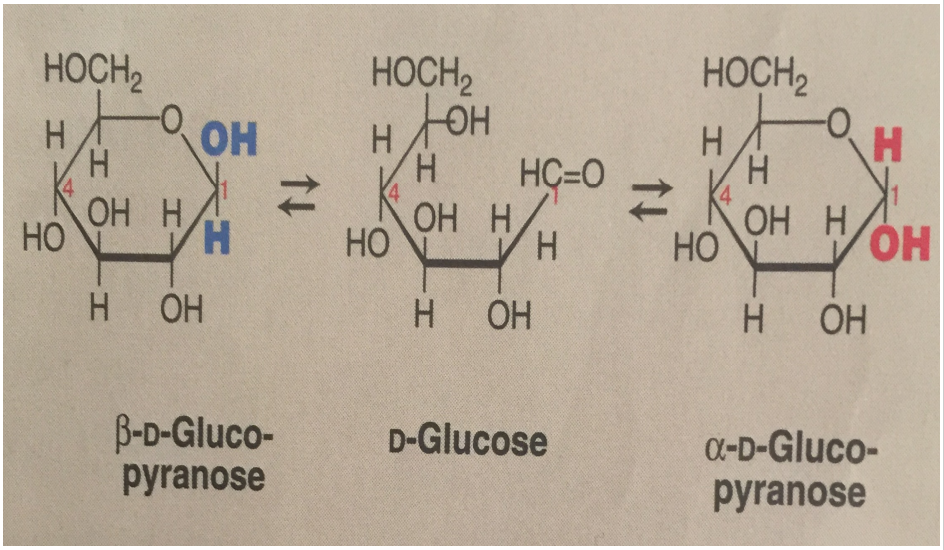




Glucose
Fructose
Isomers
Glucose and Fructose are isomers

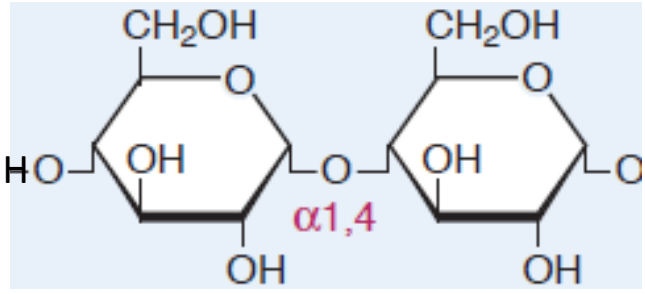


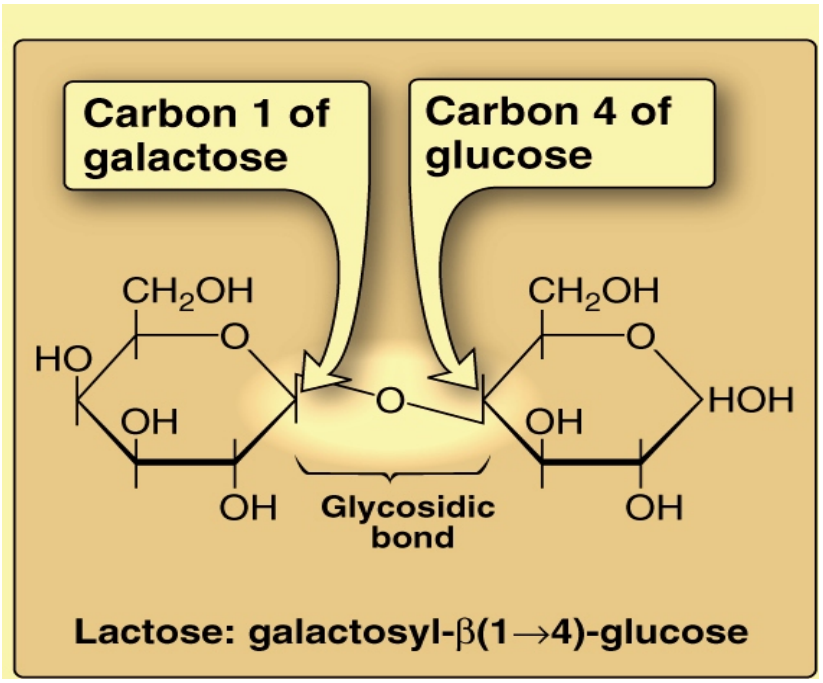
D-Glucose



Disaccharide: A sugar made of two sugar units joined by glycosidic bond

Maltose: a disaccharide made from two glucose units





Carbon 1 of galactose
Carbon 4 of glucose
CH2OH

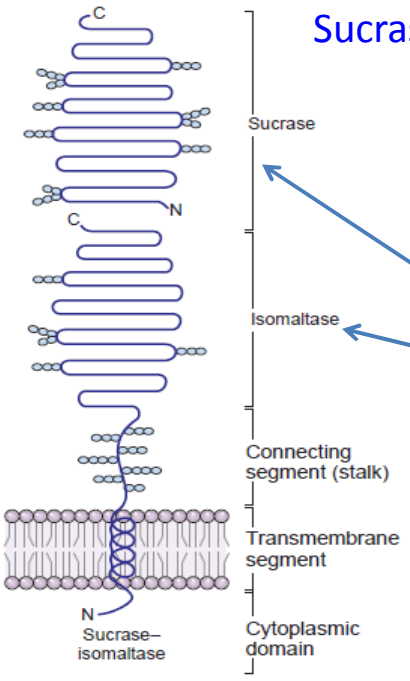
Portal circulation
Mucosal cell membrane-bound enzymes:
(isomaltase maltase lactase sucrase)
Glucose
Fructose
Galactose
Cellulose

Mucosal cell membrane-bound enzymes

ENZYME	Bond Cleaved	Substrates
Isomaltase	α 1→ 6	Isomaltose
Maltase	α 1→ 4	Maltose
Sucrase	α 1→ 2	Sucrose
Lactase	β 1→ 4	Lactose
Trehalase	α 1→ 1	Trehalose
Exoglucosidase	α 1→ 4	Glucoamylose

Sucrase-isomaltase complex and Glucoamylase



* Sucrase + isomaltase
  Single protein → complex of two associated subunits
  -Sucrase-maltase
  - Isomaltasse-maltase
  Together 80% of the maltase activity

* Maltase + exoglucosidase (glucoamylase): no split

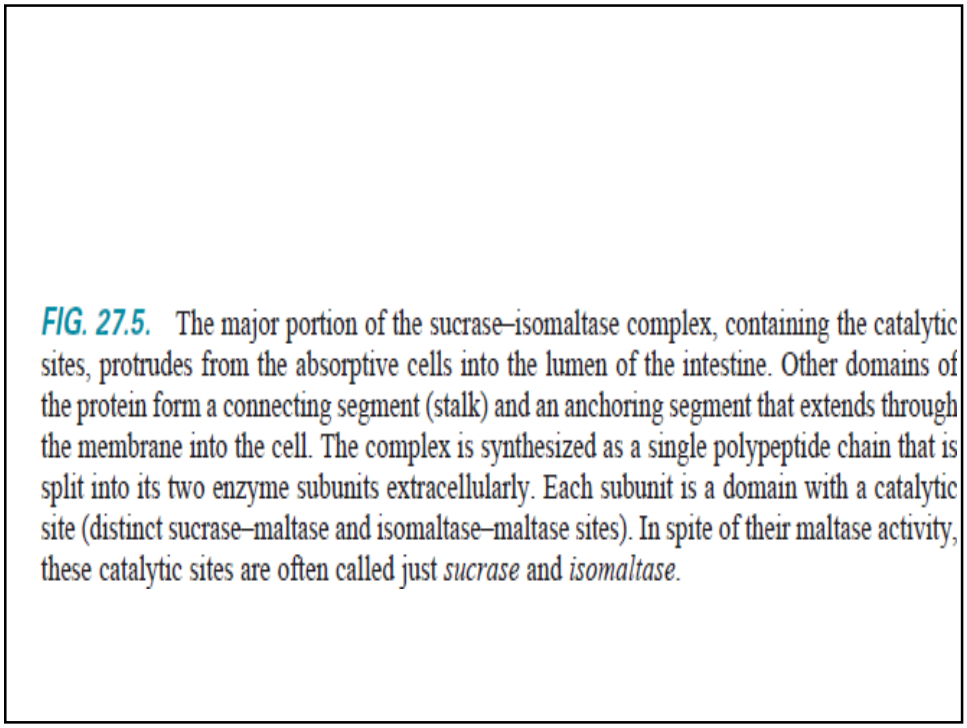


FIG. 27.5. The major portion of the sucrase–isomaltase complex, containing the catalytic sites, protrudes from the absorptive cells into the lumen of the intestine. Other domains of the protein form a connecting segment (stalk) and an anchoring segment that extends through the membrane into the cell. The complex is synthesized as a single polypeptide chain that is split into its two enzyme subunits extracellularly. Each subunit is a domain with a catalytic site (distinct sucrase–maltase and isomaltase–maltase sites). In spite of their maltase activity, these catalytic sites are often called just *sucrase* and *isomaltase*.

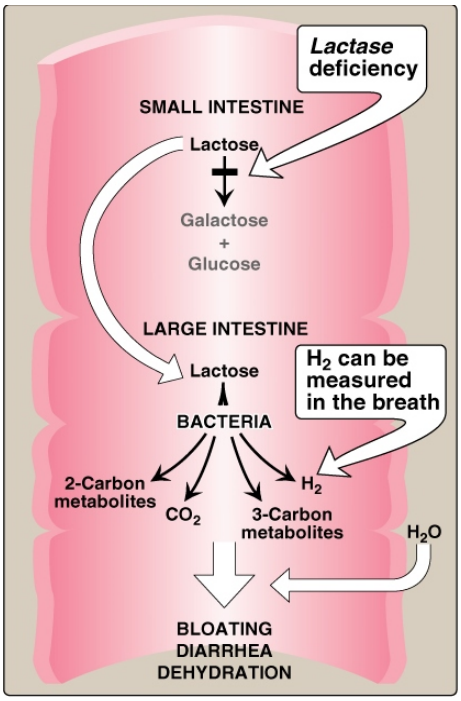
Abnormal Degradation of disaccharides

- Lactase deficiency:
- ½ world's population

- Sucrase isomaltase deficiency:

- Causes:
  - Genetics
  - Variety of intestinal diseases
  - Malnutrition
  - Injury of mucosa ie by drugs
  - Severe diarrhea



Maximal activity @ 1 month of age

Declines ----- >> adult level at 5 to 7 year of age

10 % of infant level

1 cup of milk (9 grams of lactoses) → loss of 1 liter of extracellular fluid

Absorption of Sugars

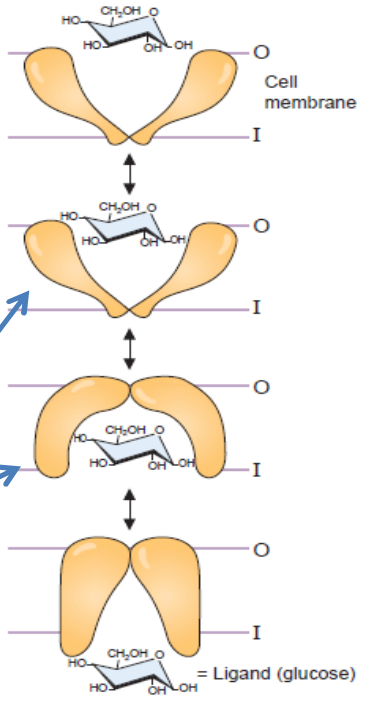
Polar molecules can not diffuse

A: Na^+-independent facilitated diffusion transport

GLUT 1-----GLUT 14

Glc. Movement follows concentration gradient

Two conformation states



Na^+ monosaccharide cotranspoerter system (SGLT)

* Against concentration gradient.
* Small intestine: Active uptake from lumen of intestine.
* Kidney: reabsorption of glucose in proximal tubule.

Na^+ monosaccharide cotranspoerter system (SGLT)

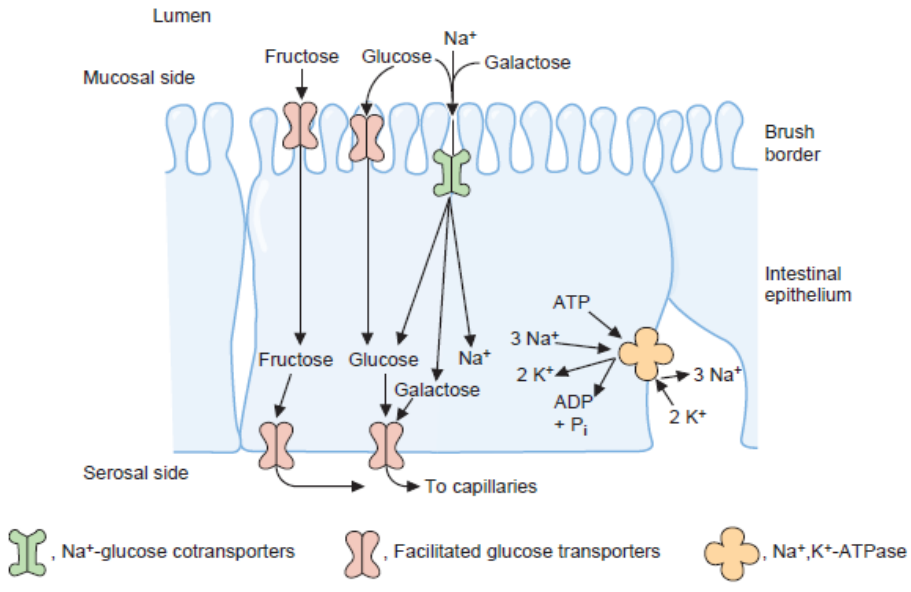


Table 27.5 Properties of the GLUT 1 to GLUT 5 Isoforms of the Glucose Transport Proteins

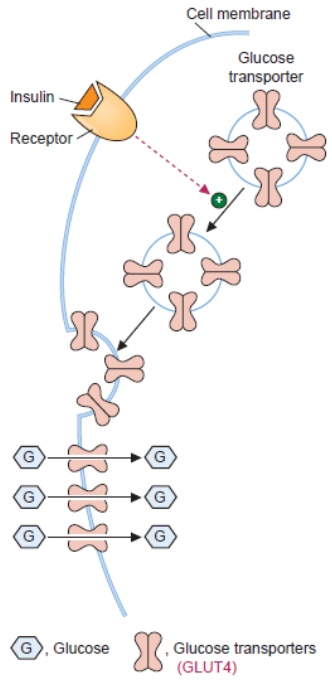
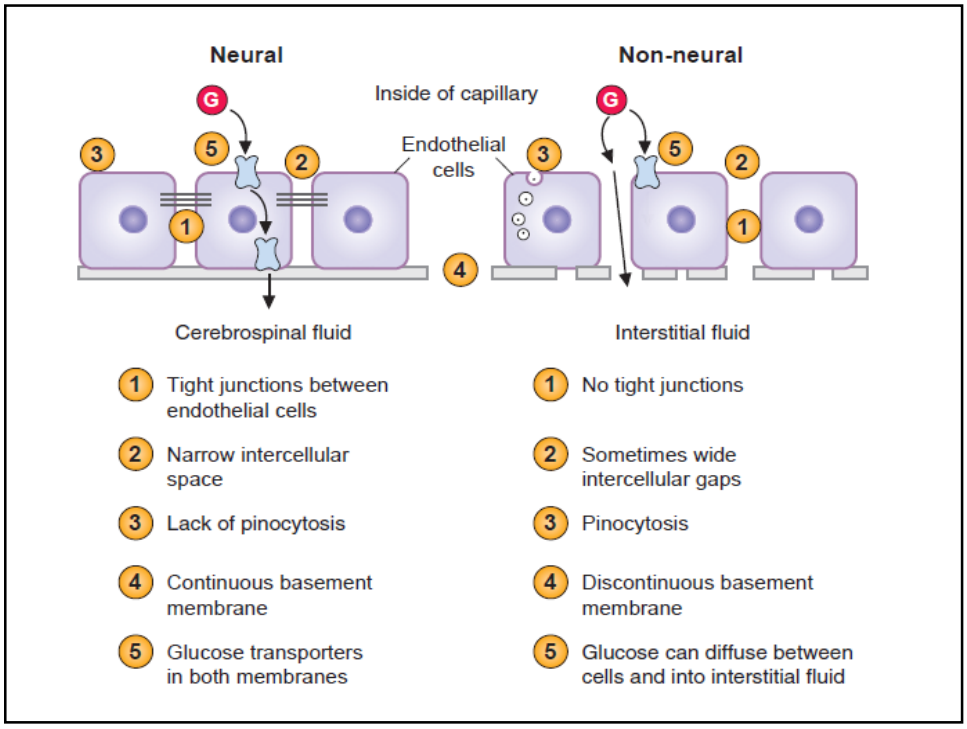
Transporter	*Tissue Distribution*	*Comments*
GLUT 1	Human erythrocyte Blood–brain barrier Blood–retinal barrier Blood–placental barrier Blood–testis barrier	Expressed in cell types with barrier functions; a high-affinity glucose transport system
GLUT 2	Liver Kidney Pancreatic β-cell Serosal surface of intestinal mucosa cells	A high-capacity, low-affinity transporter May be used as the glucose sensor in the pancreas
GLUT 3	Brain (neurons)	Major transporter in the central nervous system; a high-affinity system
GLUT 4	Adipose tissue Skeletal muscle Heart muscle	Insulin-sensitive transporter. In the presence of insulin, the number of GLUT 4 transporters increases on the cell surface; a high-affinity system
GLUT 5	Intestinal epithelium Spermatozoa	This is actually a fructose transporter
GLUT 7	Glucogenic tissues	at endoplasmic reticulum membrane



Insulin stimulates transport of glucose into muscle and adipose tissues



Neural
Non-neural
Inside of capillary
Endothelial cells
G
1
2
3

5
Cerebrospinal fluid
Interstitial fluid
1 Tight junctions between endothelial cells
2 Narrow intercellular space
3 Lack of pinocytosis
4 Continuous basement membrane
5 Glucose transporters in both membranes
1 No tight junctions
2 Sometimes wide intercellular gaps
3 Pinocytosis
4 Discontinuous basement membrane
5 Glucose can diffuse between cells and into interstitial fluid
